01 NATIONAL CURRICULUM UAE Ministry of Education, 2019 to 2021

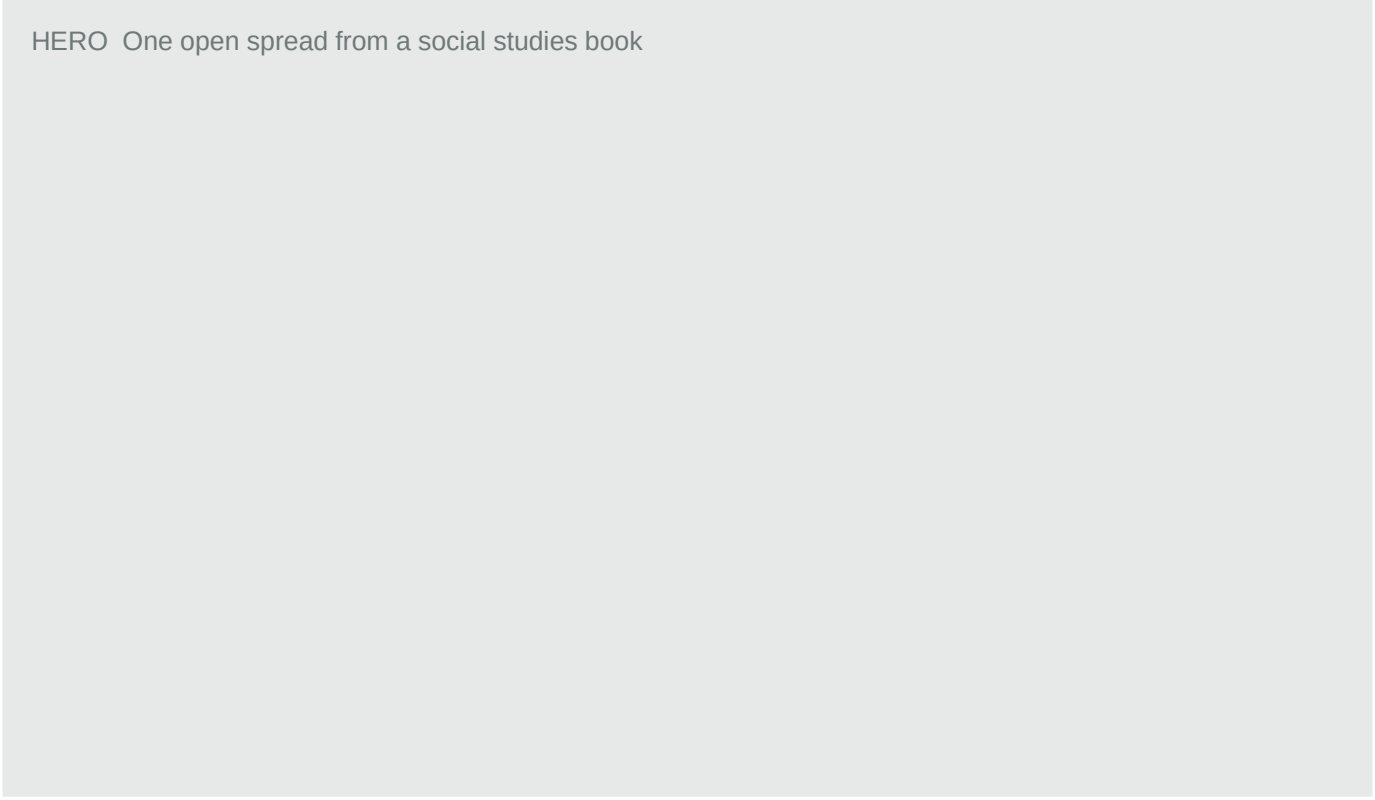

One system, a hundred books

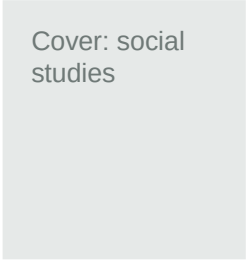

I built the visual and typographic system for the UAE's national school curriculum. Social studies for every grade from KG1 to Grade 12, in student and teacher editions. French at three levels. Two philosophy courses. Covers for music.

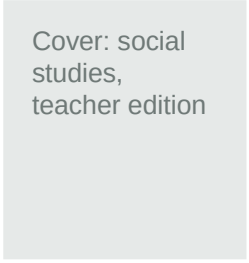

A child meets a rule in one book and has to meet it again in the next, in another subject, sometimes another script. Consistency is what lets a young reader stop decoding the page and start learning.

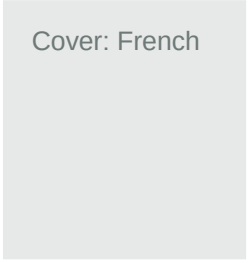

A medication leaflet fails the same way a school book does. That is the problem I want to work on in health.

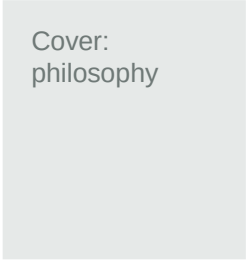

My role: creative director and team lead. I designed the system and led the illustrators, designers and layout specialists who applied it. *[Team size]*

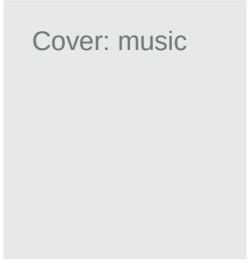

Rules a child can rely on

DIAGRAM One rule set feeding many books: grid, type, colour per subject, student and teacher editions

Type specimen: hierarchy in both scripts

ePub screen

Two readers, one book

The student book and the teacher book carry the same content for two different people. *[What changed between the editions, and why.]*

Hierarchy

[How headings, instructions and activities were told apart, and why.]

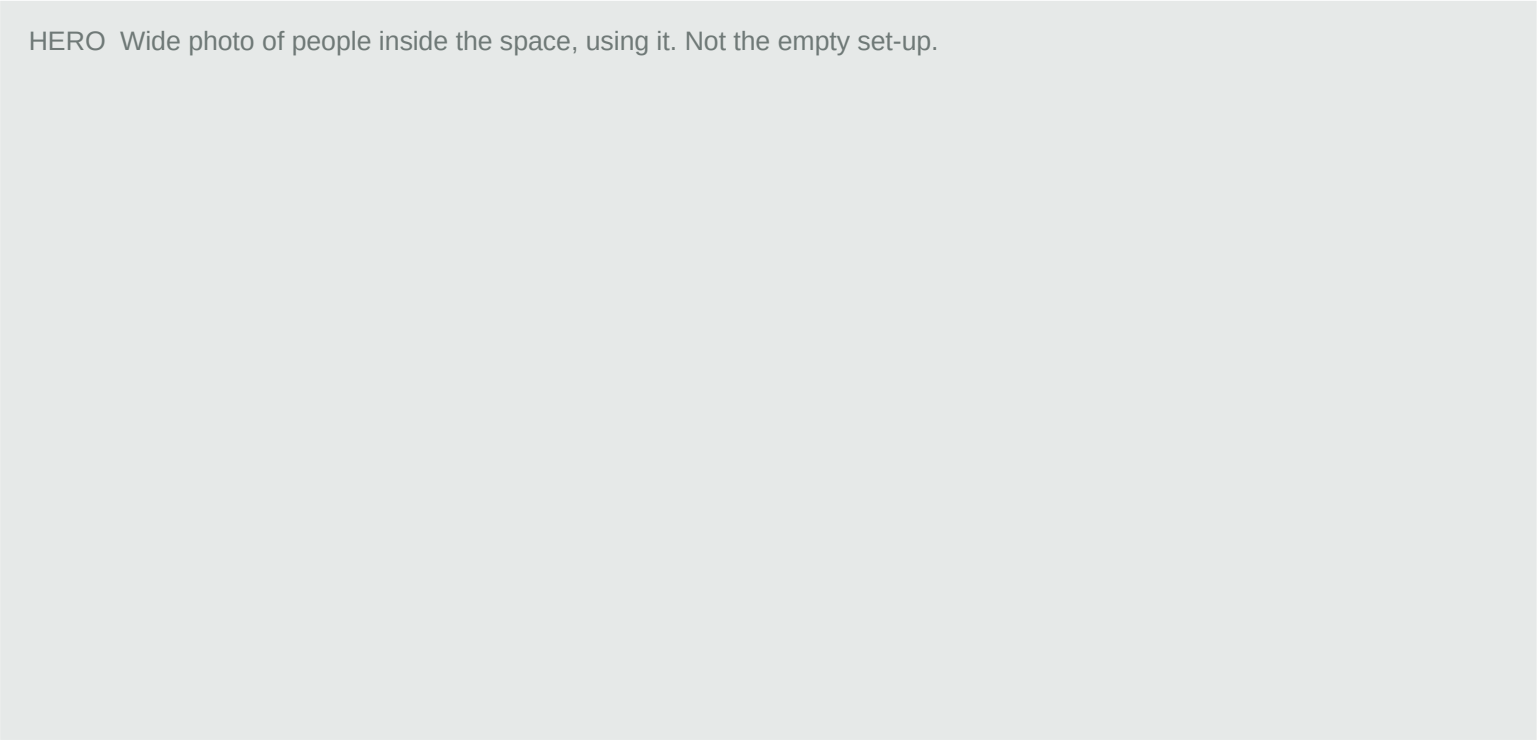

Two scripts, one grid

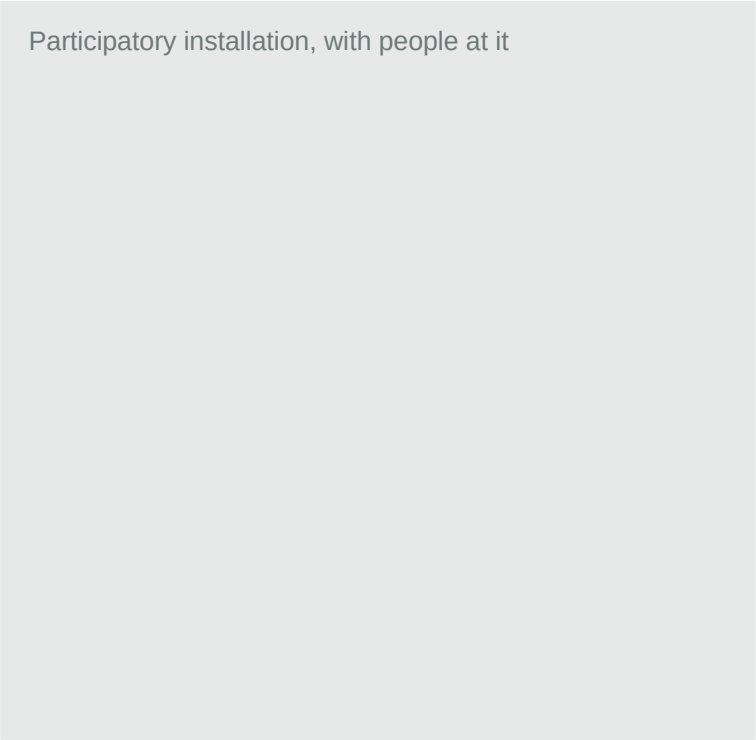

[How Arabic and Latin text shared a page: direction, baseline, what had to give.]

Print and screen

The same system ran in interactive ePub editions with embedded media. *[One change you made for screen.]*

What I would do differently now: *[One honest sentence, for example what you would now test with children and teachers.]*

A government building, opened up

My role: creative lead, at the studio I co-founded. I conceived all six interactive activations and led the creative direction of the whole experience, from concept and visual identity to on-site execution.

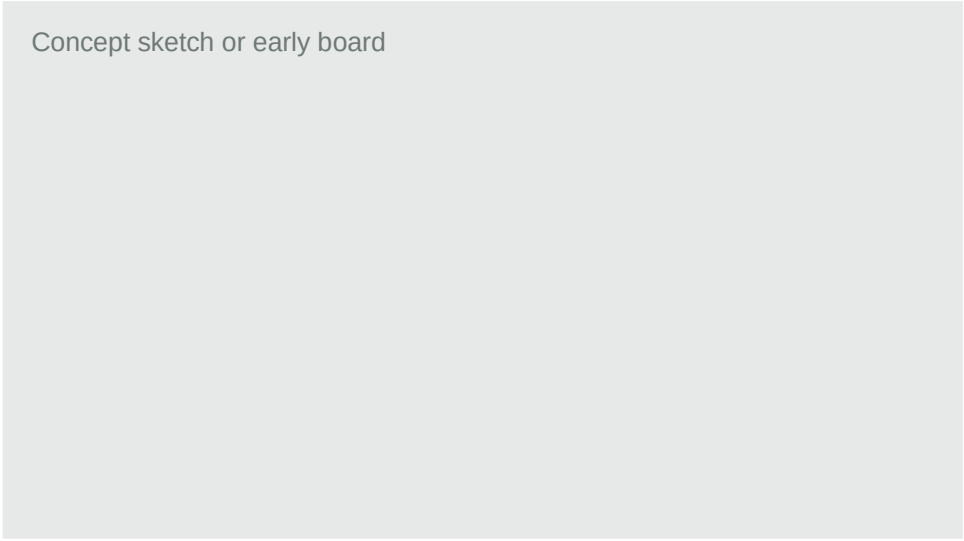

The authority wanted *[the purpose of the event]*. It ran for two days inside their own building, with a registration platform for more than 250 vacancies.

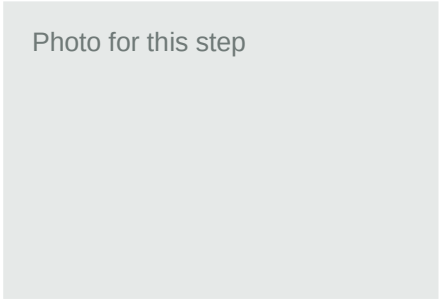

Government buildings tell visitors where they stand before anyone speaks. *[Who the visitors were.]* I read the brief as a question about how people feel in that building, and what would make them take part.

Door to registration

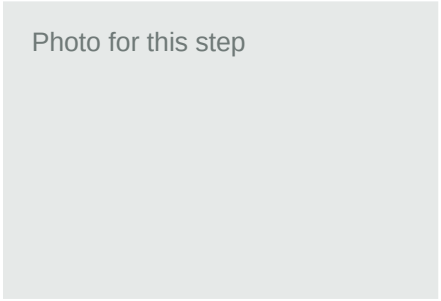

Six bilingual activations, touchscreen kiosks, a secure registration platform, environmental graphics, and a participatory installation where visitors *[what visitors did]*.

Everything was in Arabic and English. *[One decision about bilingual signage and screens, and why.]* The kiosks had to be *[one constraint, for example usable by someone who had never used one]*.

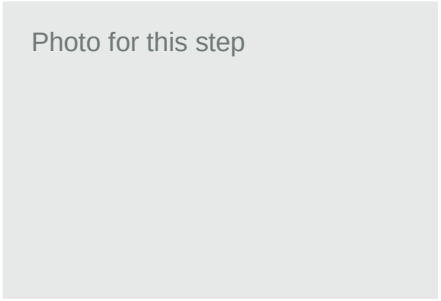

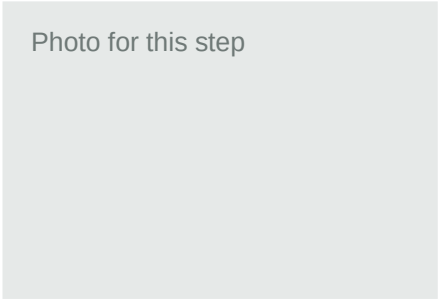

01 *[Arrival]*

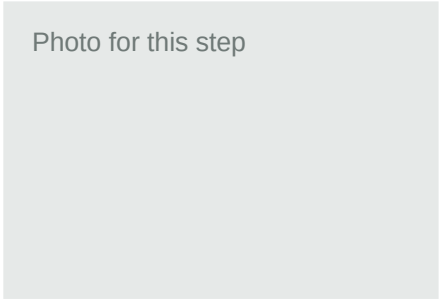

02 *[Orientation]*

03 *[Activations]*

04 *[Installation]*

05 *[Registration]*

[Rename the five steps to match the real visitor route. If you draw this route now rather than from the original plans, say so: "Visitor route, mapped after the event."]

Result: *[Registrations, attendance, or what you saw on the day. If there is no figure, one honest observation.]*

Health information, redesigned for parents

Mother, Baby & Child is a health magazine for *[who the readers were, where, in which language]*. I led its rebrand.

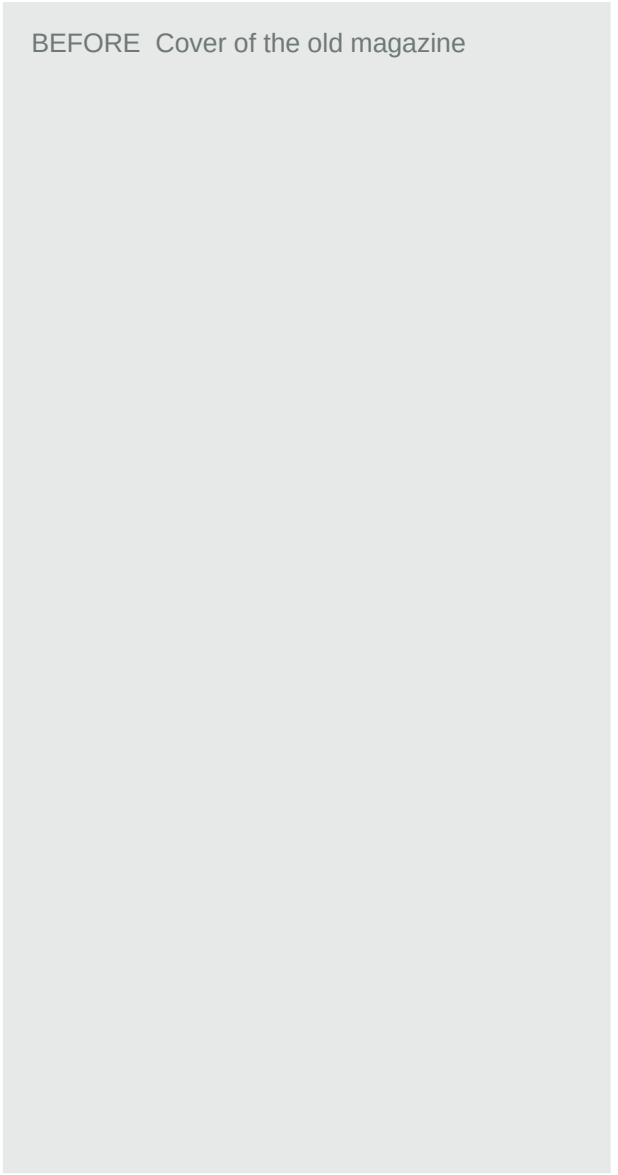

[What was wrong before: what made it hard to read, find or trust.]

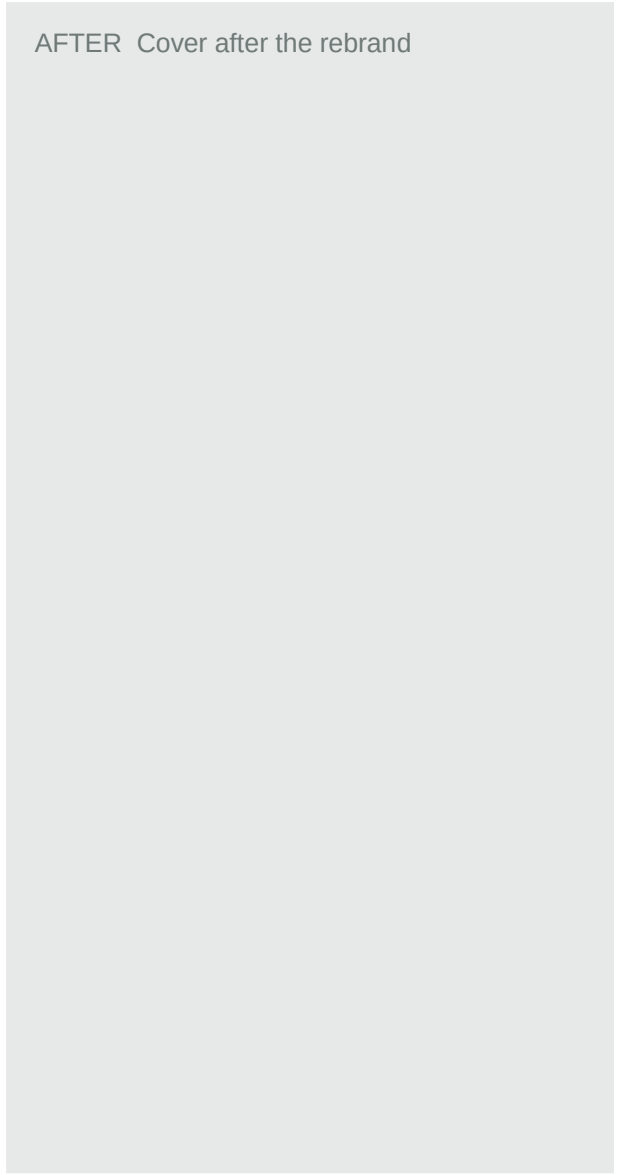

[What you set out to change, and why.]

+38%

subscriber growth in the period after the rebrand
[period]

My role: art director. I led the rebrand. *[What you designed yourself, and who else worked on it.]*

Inside the pages

BEFORE An inside spread from the old magazine

AFTER The same kind of spread after the rebrand

[Decision 1]

[For example: how a parent finds the section they need.]

[Decision 2]

[For example: how advice, warnings and facts were told apart.]

[Decision 3]

[For example: how the photography or illustration changed.]

What I learned: *[One sentence in your words. What this project taught you about designing health information, and what you would now test with readers.]*
